. . . Well here's my version: I didn't really know how to go about creating the army, but I did figure out how to use . . . My question here is, which colour scheme is the best? A: I can't say I'd agree that the list of choices is that "narrow", but I will say that I personally prefer a more muted color palette. You can give it more variety by having a solid color for your helmet and arms, and a lighter color for your torso, but you can do that with a lot of other Eldar armies. I think that a more muted palette, like you suggested in your question, works well with the variety of colors in the color of the planet. Black is good, because it works well with red or silver or gold (or all of them). Other colors don't really stand out as much. By contrast, yellow works well on a blue planet because of the juxtaposition of blue and yellow (of course I'm just talking about how colors look in pictures and on a computer, but that's the reason for the comparison to begin with). Also, you may want to consider just doing a smaller list

---

of colors (or colors in a particular family, like red, green and blue, yellow, etc.). In fact, my first suggestion would be to change the colors of the planet a little more, and make the red, orange and yellow colors a bit darker, so that they would stand out a bit more. Of course, the final answer to that is your own decision, and it's just my opinion. A validation study of different scoring systems in distinguishing stroke patients from non-stroke patients. Stroke is the second-leading cause of death and one of the leading causes of disability worldwide. Although stroke is a common emergency in a hospital, the number of patients whose stroke is misdiagnosed is still too high. Thus, to minimize the misdiagnosis of stroke in the emergency department, it is essential to distinguish stroke patients from non-stroke patients. In this study, we aimed to develop a scoring system for distinguishing stroke patients from non-stroke patients in emergency department. We performed a secondary data analysis based on a prospective study enrolling subjects with acute stroke (stroke and non-stroke patients) in six public hospitals. We selected factors related to stroke such as neck pain, headache, dizziness, nausea, confusion, and inability to walk, and their 82157476af
